

Query Console

The Query Console displays query results based on [iteraQL](#).

UI reference

1. Send Query
2. Clear the query console
3. Queries History
4. Result set as a table
5. Save the query
6. Show result as a diagram
7. Show result in list

The last executed query is automatically loaded from the user profile when the Query Console page is opened.

Query Result

Result set

The result of the query is shown as a table at the bottom. Depending on the result type additional actions are possible similar to the [Building Block List](#).

Query history

The last 5 queries sent are saved as user specific local Query history. In the Query history menu they can either be deleted, copied or directly executed.

Save Query

You can save the actual query as [Saved Query](#).

Diagram

You can take over the results into diagram view. Only the result elements are transferred and not the filter or columns.

List

You can take over results into list view. Only the result elements are transferred and not the filter or columns.
